

## *Unit II – pgs. 156 - 181*

Population

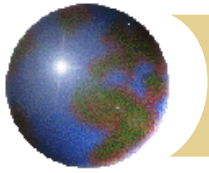

# Canada's Population

- ✦ Canada is the 2<sup>nd</sup> largest country in the world, but in terms of **population** it is a relatively small country, with approximately **35.16 million people (2013)**.
- ✦ Why?
  - Much of Canada's land area is inhospitable.
  - Most Canadians live along the Southern Fringe.
  - 3 out of 4 Canadians live in cities or towns.

# A. Definitions:

# 1. Demography:

- Is the study of population, its numbers, distribution, trends, and issues.

## 2. Population:

- ✦ Measure of the # of people who live in a specific place at a specific time.
- ✦ Usually follow a political boundary such as a country, province or town.

### 3. Diversity:

- ✦ A variety of different kinds of people.
- ✦ Example:
- ✦ Canada has a very diverse population. i.e. many different ethnic groups.

## 4. Population Density:

- ✦ Refers to the number of people within a measured land area.
- ✦ Usually measured in  $\text{Km}^2$  or  $\text{m}^2$

# Calculated by:

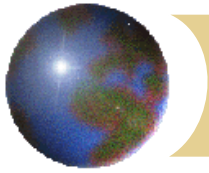

- ⊕ Number of people **divided by** Land Area

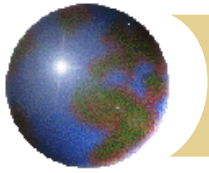

## Example:

- ❏ Newfoundland population = 509 700
- ❏ Area of Newfoundland = 371 690 km<sup>2</sup>

What is the population density?

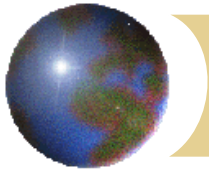

- Population Density= Number of people/Land Area
- Number of people = 509 700
- Land Area= 371 690 km<sup>2</sup>
- **Population Density: 509 700/371 690 km<sup>2</sup>**
- **Population Density= 1.37 people/km<sup>2</sup>**

# What does this mean?

- ⊕ **High population density** occurs in places in which a large number of people live in a small land area.
- ⊕ **Low population density** occurs in places where few people live in a large area of land.
- ⊕ Does Canada have a **high** or **low** population density? **Why?**

# Dispersed vs. Concentrated

- ✚ A population can be dispersed or concentrated.

# Dispersed:

- ✚ A population is **Dispersed** if people in the population do not live close to one another.

- ✚ Spread out.

Ex: The Gould's is more **dispersed** than St. John's.

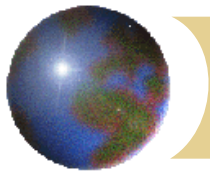

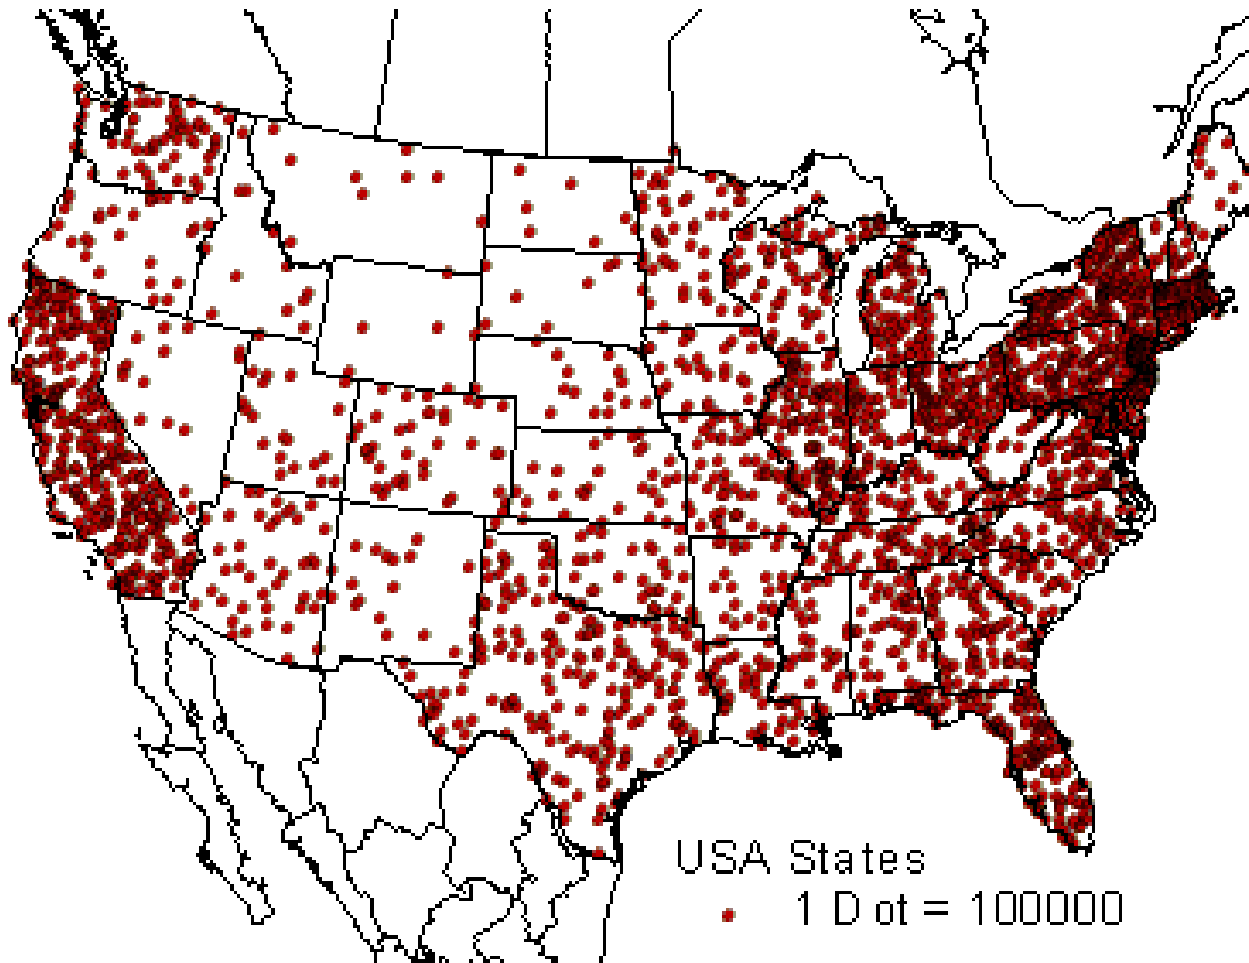

# Concentrated:

- ✦ A population is **Concentrated** if the people are living close to one another.

Ex: St. John's is more **concentrated** than the Gould's.

# Is this dispersed or concentrated?

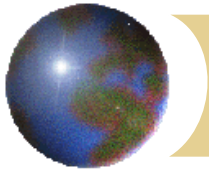

## 5. Population Distribution:

- ✚ The pattern of population in an area.

# **Sparsely vs. Dispersed Populations:**

# Sparsely Populated:

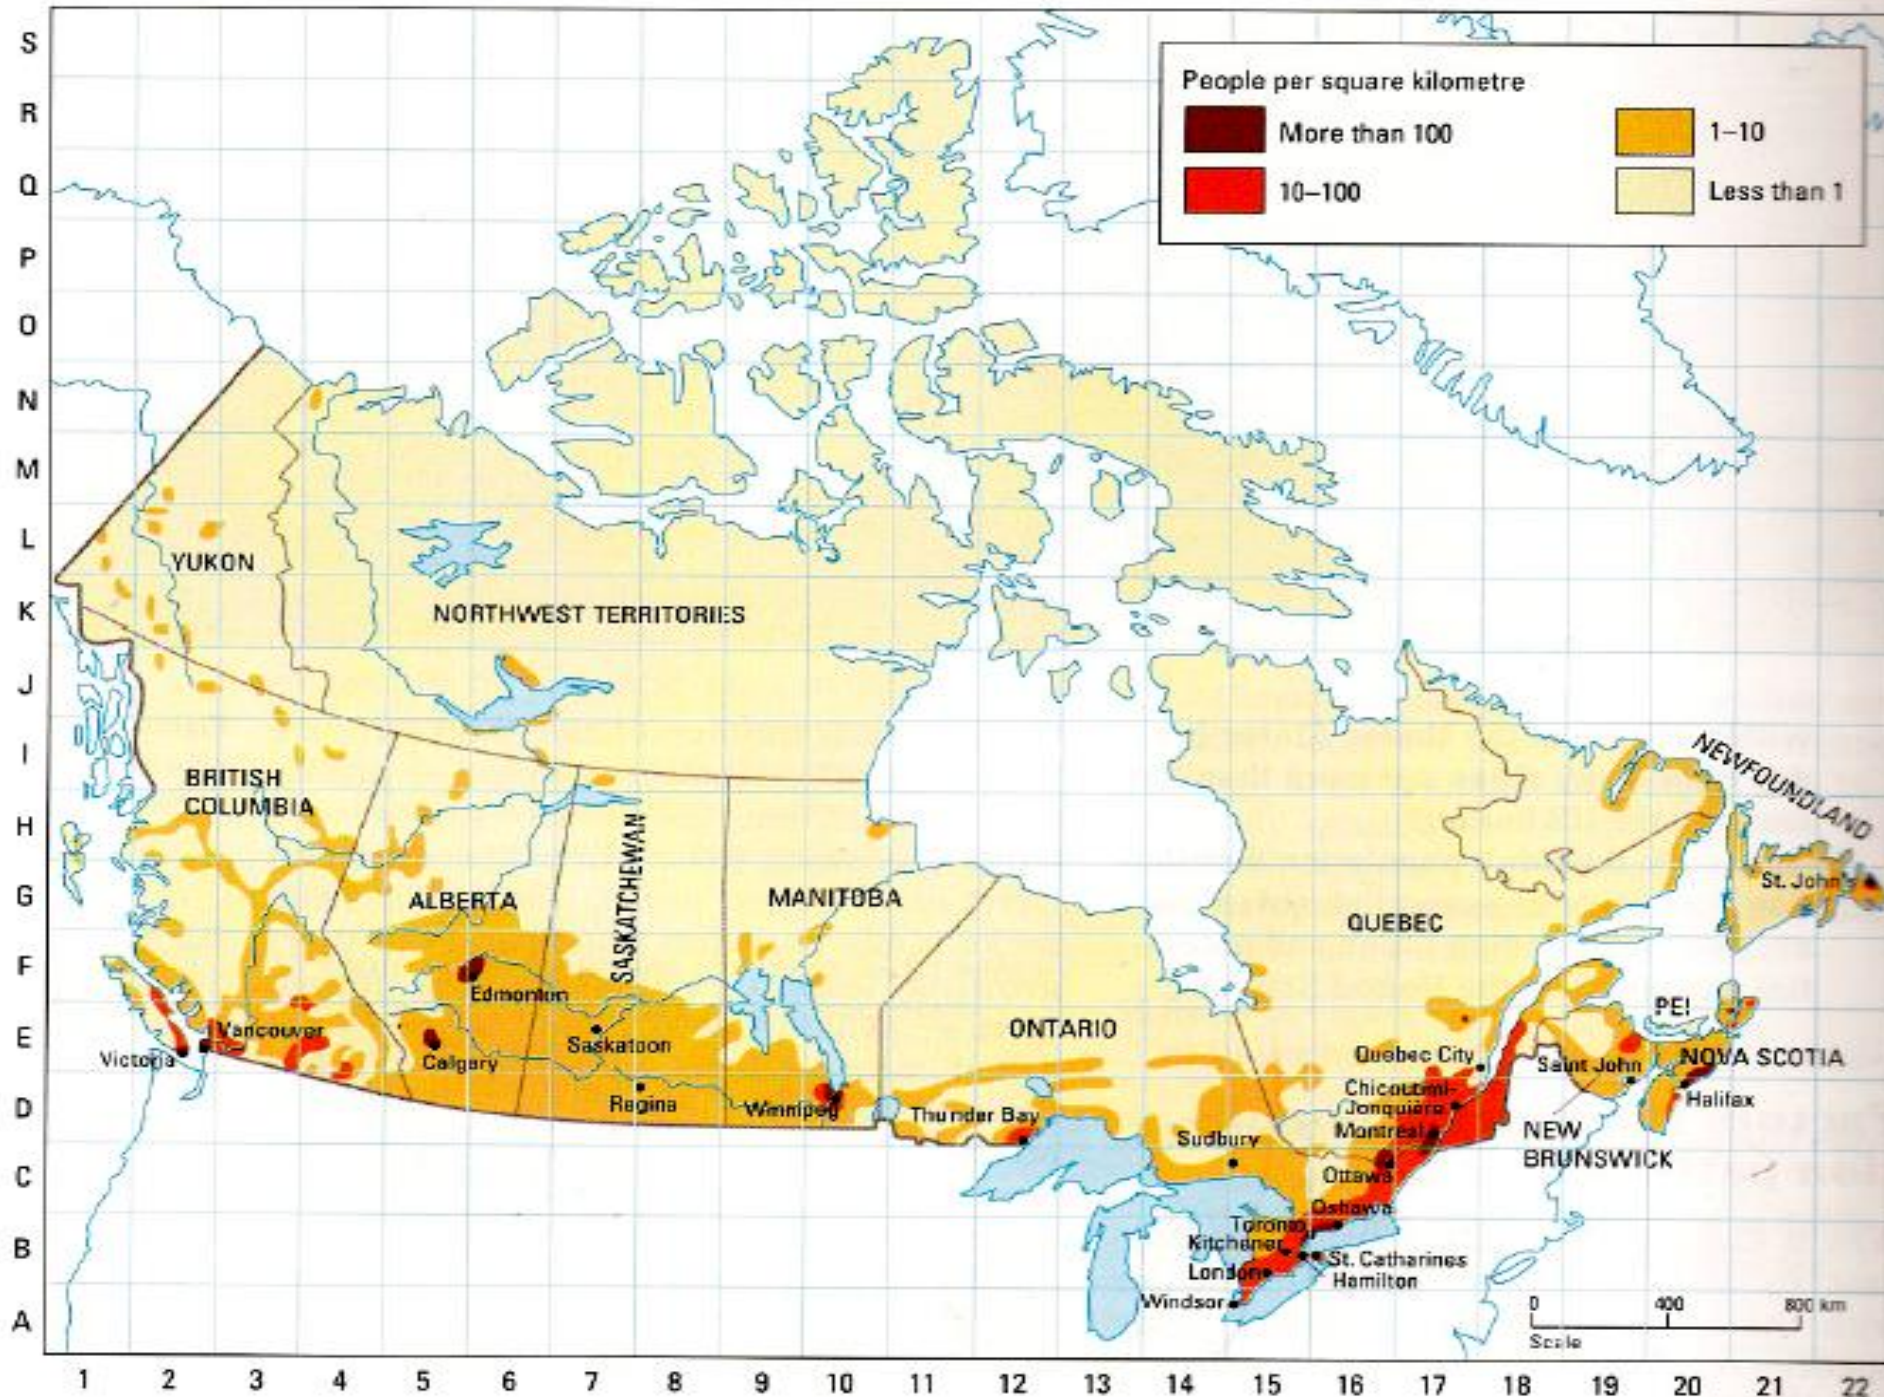

- ✦ Small number of people in a given area (Northern Canada)
- ✦ In general terms we say **less than 100 people/Km<sup>2</sup>**

## Densely Populated:

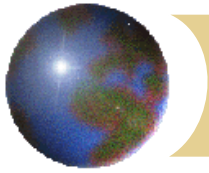

- ✦ High number of people in a given area.  
(Area around Great Lakes).
- ✦ In general terms we say **more than 100 people/Km<sup>2</sup>**

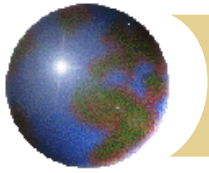

## **B. Systems affecting population density and distribution:**

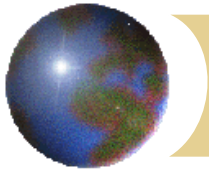

# 1. Climate:

- ❖ Warmer comfortable climates attract people.
- ❖ Most people live in a moderate climate region.

## 2. Economics:

- ❖ Urbanization and the move to the industrialization and now the information ages have changed population distribution, to larger cities.

### 3. Transportation:

- ✚ Coastal regions attract business and people because of ocean transportation.
- ✚ Most major cities are located on the coast.

## 4. Culture:

- ❖ The way in which a group of people live.
- ❖ It includes their beliefs and traditions and involves such things as food, language, music and even recreational activities.

## 5. Cultural Imprints:

- ❖ Each group of Canada's diverse population has brought aspects of their cultures with them. Thus, each cultural imprint is part of our country.

## 6. Multiculturalism:

- ❖ An official policy of Canada which encourages respect for cultural diversity within our country.

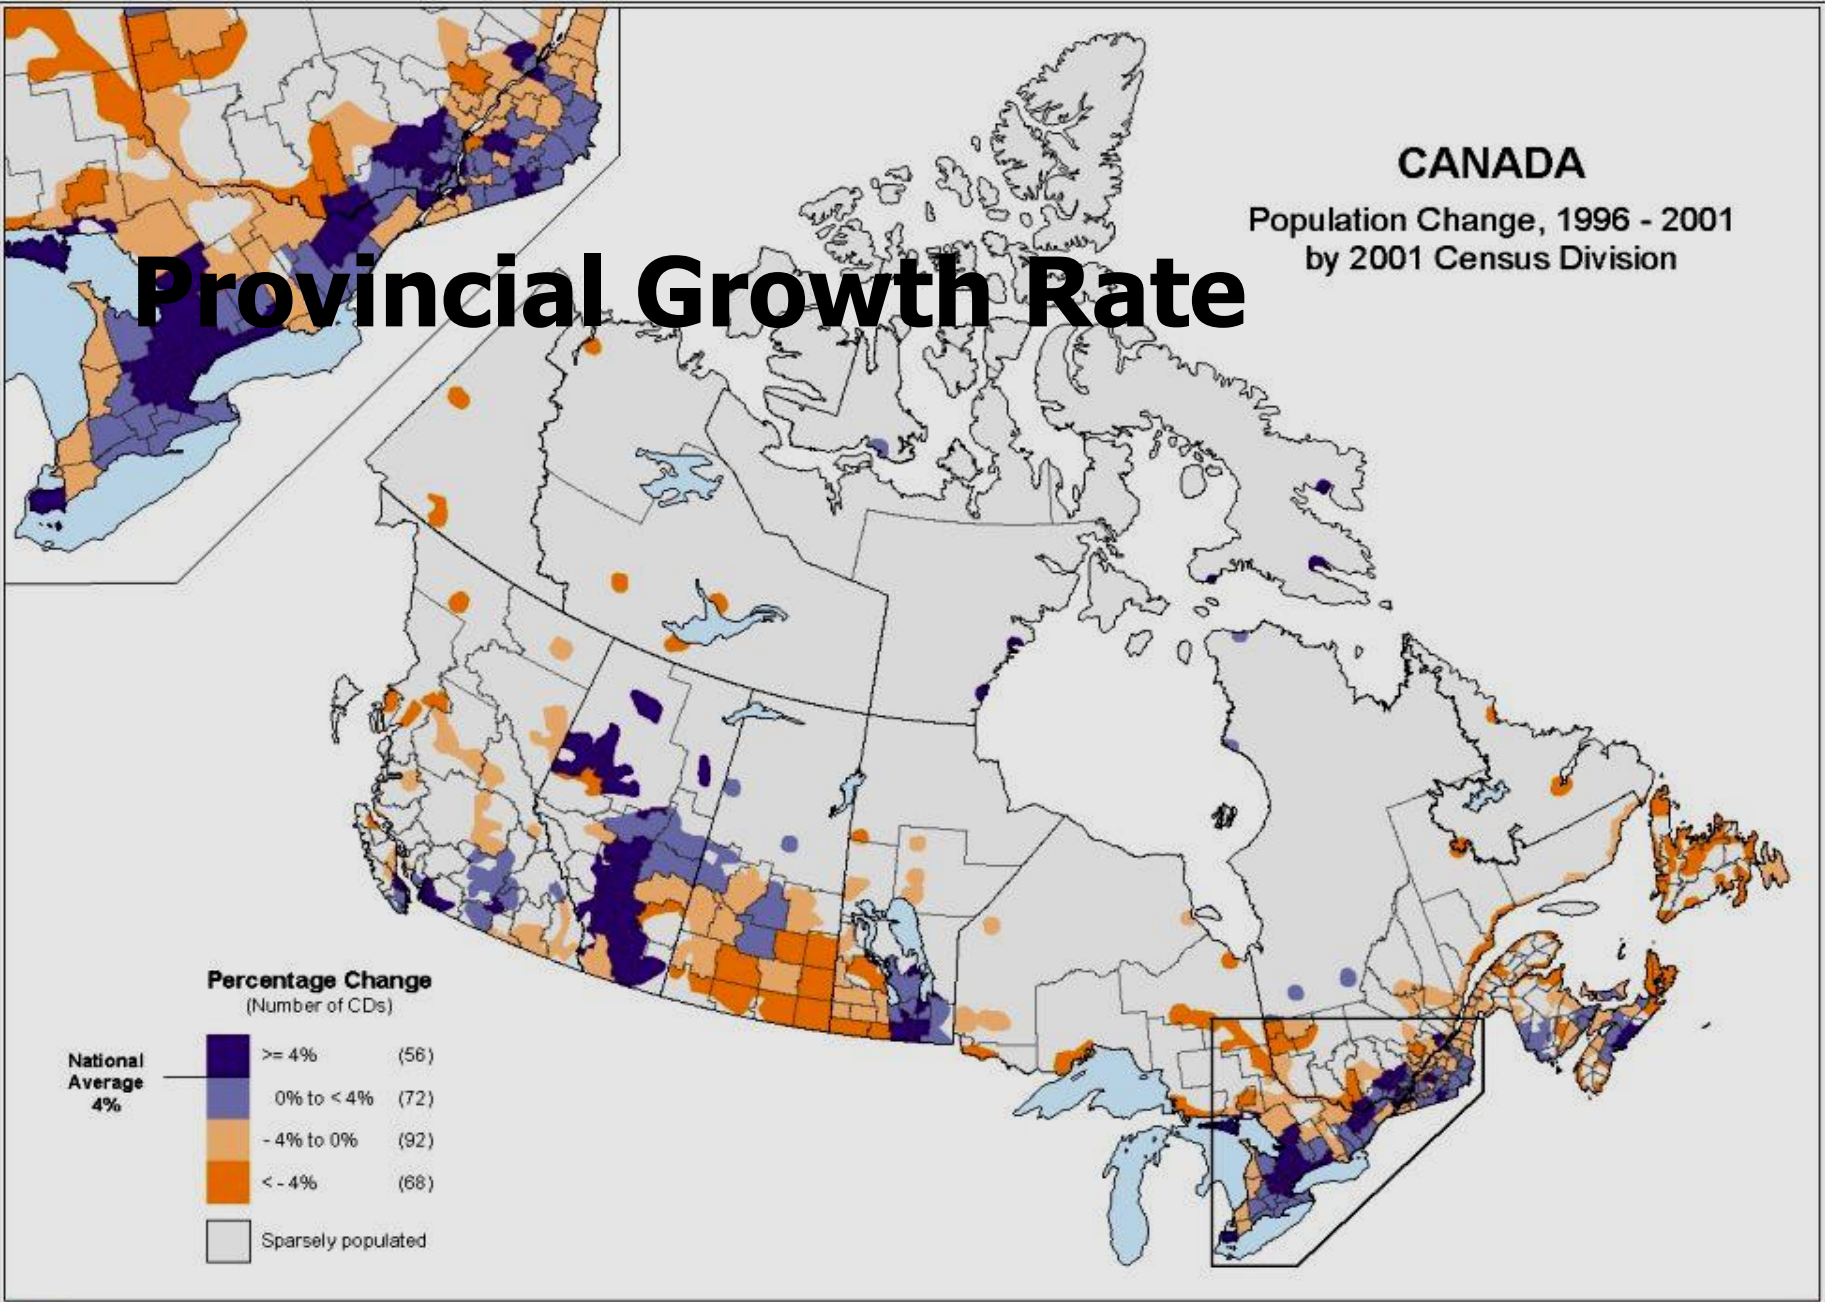

# C. Population Growth:

# Canada's Population Growth Rate

# Growth Rates:

- ✚ Is the percentage increase of a population **divided** by the previous population total.

# Birth Rates:

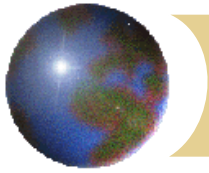

- ❖ A measurement of the number of births (in one year) per 1000 people.

# Calculated By:

$$\oplus \text{ BR} = \frac{\text{\#Births}}{\text{Total Population}} \times 1000$$

# Death Rates:

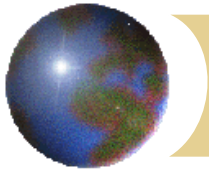

- ❖ A measurement of the number of deaths (in one year) per 1000 people.

# Calculated by:

$$\text{DR} = \frac{\text{\# of Deaths}}{\text{Total Population}} \times 1000$$

# Natural Increase:

- ✚ The difference between the birth rate and the death rate

# Calculated by:

⊕ NI: birth rate – death rate

⊕ REMEMBER NOT BAD TO HAVE  
NEGATIVE NUMBERS IN POPULATION

⊕ WHY?????????

⊕ Correct: you are losing more than  
gaining. (death or migration)

## D. Population Pyramids:

- ✦ Also known as an age-sex pyramid.
- ✦ Graphs that reveal patterns in information about populations which enables one to make comparisons between men/women or young/old.

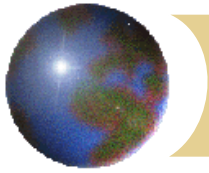

# Example:

# Classifying Population Pyramids

# 1. Expansive or Expanding:

- ✚ Have a triangular or pyramid shape.
- ✚ The wide base indicates a high birth rate and the narrow top indicates a high death rate.

**Chart 7. Population pyramid, India, 2006**

SOURCE: Population Reference Bureau projections, based on the 2001 Census of India.

## 2. Stationary or Stable:

- ✦ Have a  $\frac{1}{2}$  eclipse shape.
- ✦ The base is similar in width to the population of the reproductive ages which indicates a stable population.

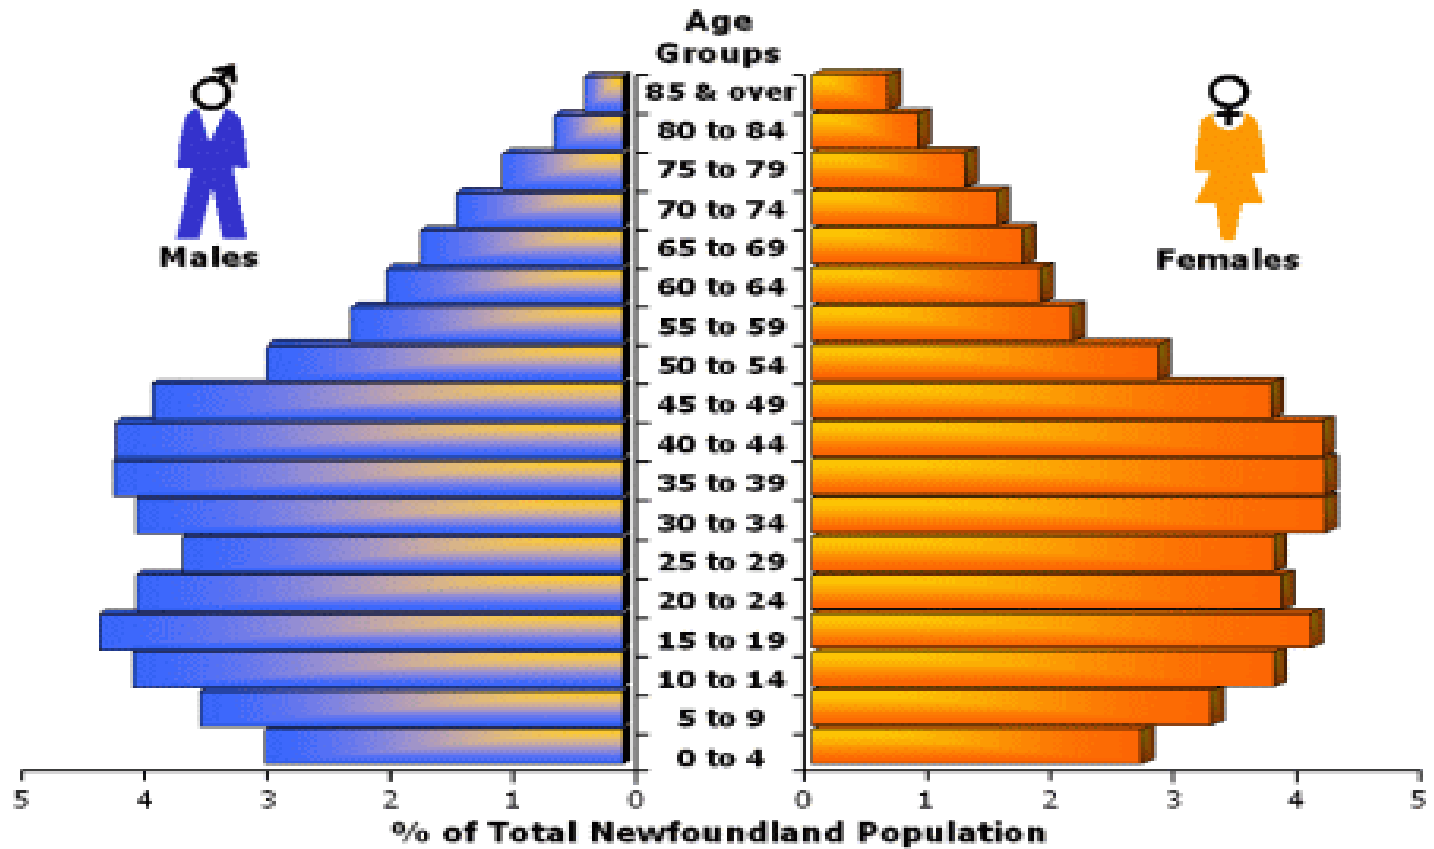

### China: 2050

### 3. Contractive or Contracting:

- ✚ Have a narrower base than the reproductive age population.
- ✚ This indicates a decreasing population.

# Reading Population Pyramids:

- ✚ Observing different characteristics of the population pyramid can tell you a lot about the population.

# 1. Width of the Base:

- Wide base indicates high birth rate, narrow indicates low birth rate.

## 2. Symmetry:

- ✚ Males and females are usually similar, any asymmetry indicates a difference between male and female population.

### 3. Shape of sides:

- ✚ Concave sides indicate a high death rate and convex sides indicate a lower death rate.

## 4. Bumps in the sides:

- ✚ Irregularities in the sides indicate a demographic anomaly, such as a war.
- ✚ Note: This bump will travel upward with time.

# Dependency Load:

- The portion of the population under 16 and over 65.

## Calculated by:

❖ Dependency Load for Canada in 2005 was:

2 000 000 males over 65

2 600 000 females over 65

3 000 000 males under 15

2 900 000 females under 15

*Answer:*

$$\begin{array}{r} \oplus 2\,000\,000 + 2\,600\,000 + 3\,000\,000 + \\ 2\,900\,000 = \text{?????} \end{array}$$

$$\oplus 10\,500\,00$$

# Dependency Load Effects:

- ❖ A high dependency load has an effect on:
- ❖ **Tax Level:** High dependency load means less people work. Therefore, taxes are raised to make money for government.
- ❖ **Jobs:** high dependency load means more jobs are available.

Done !!!!!!!

***YOU WILL WORK ON POPULATION  
PYRAMIDS!!!!***
